

completion information (Summary declaration) (SI-SUM, SumAErledigungsinformation)

The "completion information" is used to transmit completion information after these messages have been properly processed

- „split"
- "consolidation"
- “Re-export

or

- Completion by ATLAS subsystem NCTS
- Completion by ATLAS subsystem customs treatment upon release or manual completion by the user
- processing by ATLAS subsystem EAS in the case of release for re-export.

Remarks:
The purely technical (partial) completion of a SumA item is communicated with the "completion information". In the case of settlement through splitting or consolidation, the temporary storage of the new SumA positions is monitored. When dealing with the interface from the ATLAS sub-system customs treatment, the temporary storage only ends when the goods are released for customs treatment. For processes that are not to be paid for in cash, the "completion information" has the legal relevance "goods are left".

The "completion information" is not a confirmation that the SumA has been completed in full. It only serves to provide information as to which positions have been completed with how many pieces.

If a completion is canceled, "completion information" is transmitted, which contains the cancellation indicator in attribute SI1040.

In the case of CDX goods, the "completion information" is provided via the BOX object "SC".

There are two types of completion information:

- Completion information for the previous paper (SI-VRP) which can be found e.g. B. refers to an AZ or NE and
- the completion information SumA (SI-SUM) which z. B. refers to a VV, SN.

The SI2000 attribute has a different meaning depending on the type of completion information:

- In "SI-SUM" this attribute contains the completed position number.
- In "SI-VRP" this attribute contains a sequential number. The completed position number can be found under attribute SI2020.

Example of receiving completion information:

All information in this document is purely informative and does not constitute instructions or templates for submitting customs declarations.

In ZODIAK, two SumA were created, each with two positions and are completed using an AZ. The following completion information is then reported via the BOX:

- The completion info on the AZ (SI-VRP) contains the completed ATB15 numbers with their positions.
- The completion info, which refers to the respective VV (SI-SUM), contains only the corresponding ATB15 number and the completed items.
