

consolidation (VV-CON, SumAKonsolidierung)

The "consolidation" is used to transmit data from a consolidation of SumA positions to a new process with exactly one position. With this message, the data for the consolidation of several items of different summary declarations can be transmitted to a new process.

Remark:
With the action (OB0050) "**CREATE**" a new consolidation is created in ZODIAK. At header level, the attribute VV2150 (type of identification) is used to specify whether the identification that follows at item level will be carried out using a MRN / registration number (“REG”) or AWB information (“AWB”).
The individual items to be consolidated are reported via the attributes from attribute VV5000 (sequential number of the items to be consolidated) and according to "Type of identification" (VV2150 at header level) either with "AWB" with the information " Type of SpO” (in VV5190), SpO (in VV5200) and depositary (in VV5210) or in the case of “REG” by the MRN / registration number (in VV5220) together with the registration number position (in VV5230).

If the consolidation created in ZODIAK via "CREATE" is to be corrected, it can be completely replaced via the action (OB0050) "**REPLACE**" as long as no MRN / registration number has been assigned by ATLAS to the consolidation.

With the additional specification of the action (OB0050) "**SEND**", an automatic transmission of the consolidation created in ZODIAK to ATLAS can be requested. This action is only carried out if the certified plausibility checks in ZODIAK do not identify any plausibility violations. The BOX receipt (BQ) generated for each transaction sent to the ZODIAK-BOX informs about the result of this check as well as about the successfully and unsuccessfully performed actions.
